Discovery and Planning

Jamie Maguire

Software Architect | Developer | Microsoft MVP (AI)

@jamie_maguire1 | www.jamiemaguire.net

Overview

- Partners, vendors, and technology
- Existing data quality and assets
- Use cases and existing technology
- Planning and creating a roadmap

Partners, Vendors, and Technology

Why Use Partners and Vendors

- Specialized expertise
- Stay up-to-date
- Rapid development
- Reduce costs
- Identify opportunities
- Competitive advantage

Criteria to Consider

- Expertise
- Industry Experience
- Scalability
- Alignment
- Tech Stack

Identifying Potential Partners

Conduct thorough research

Online resources

Industry events

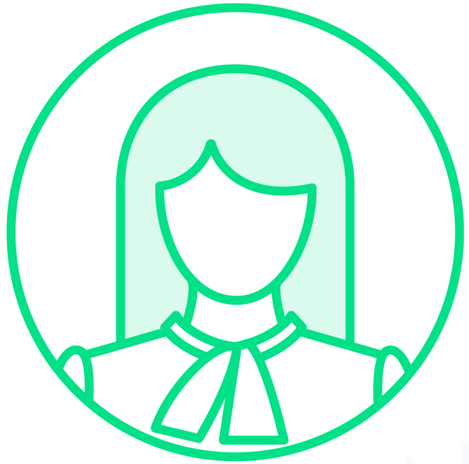
Existing network

Partner and Vendor Capabilities

IT

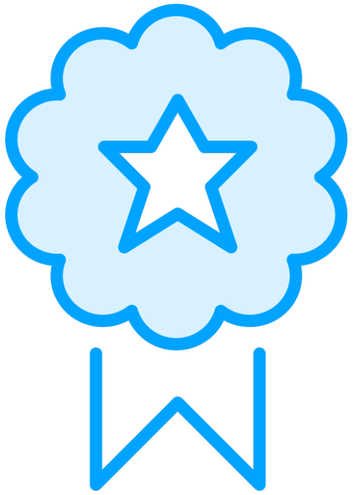
Legal

Compliance



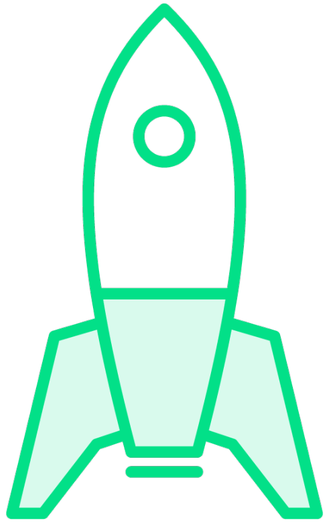
HR

Due Diligence



Verify

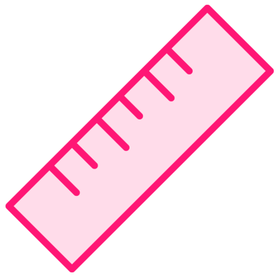
Track record and case studies



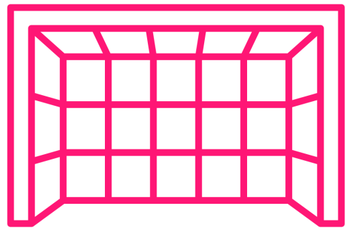
Reference

Existing AI case studies

Assess Compatibility



Alignment



Goals

Values

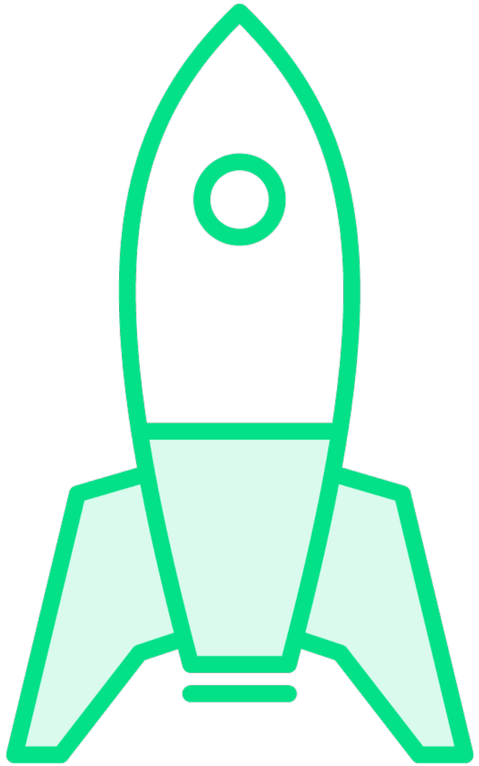
Narrow down

Refined group

Preferred suppliers

Initiate discussions

Create prototype



Sign agreement

Clear plan

Collaboration

Communication

Monitor and Assess

Meeting objectives of your AI strategy

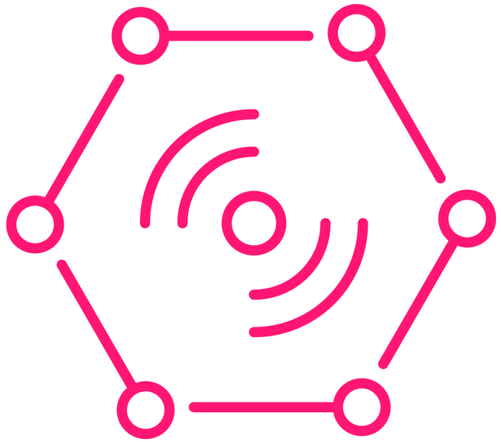
Adjust course if needed

Contractual adjustments

Existing Data Quality and Assets

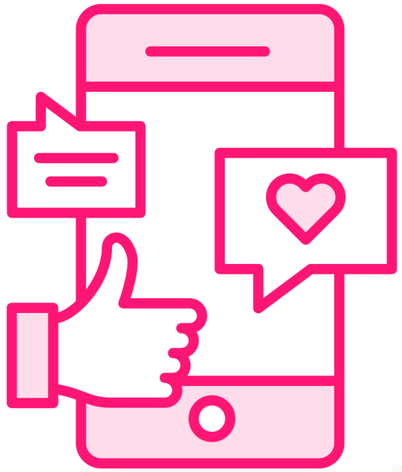
Example Datasets

Demographics



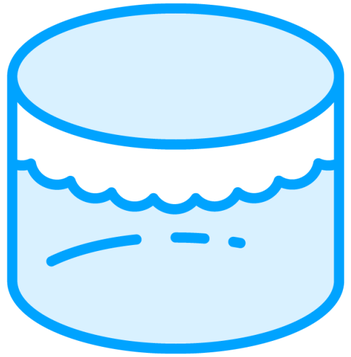
IoT

Historical

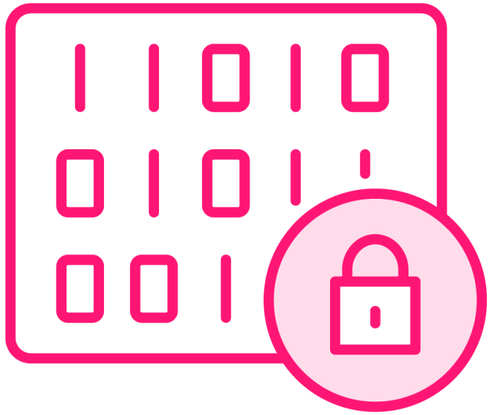


Social media

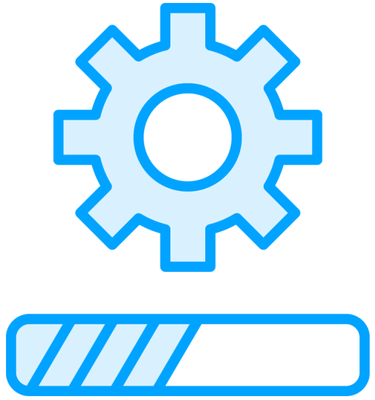
How Data Is Used



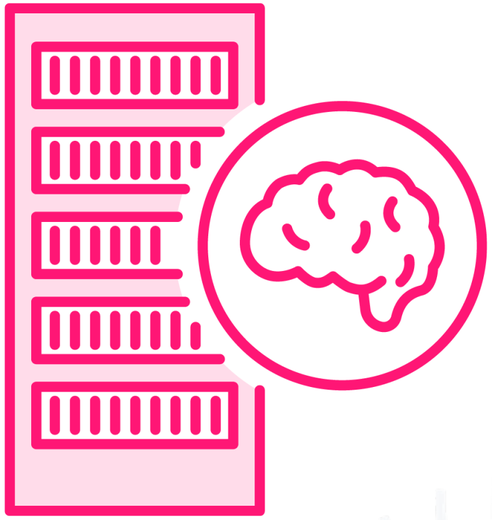
Training data



Testing data

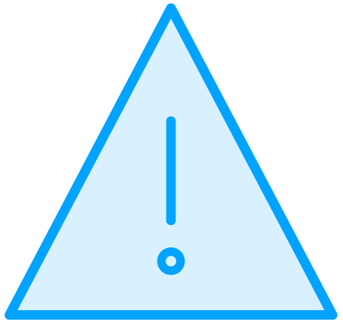


Deployed

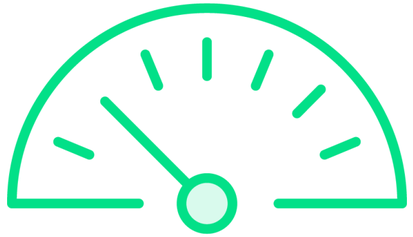


Continuous learning

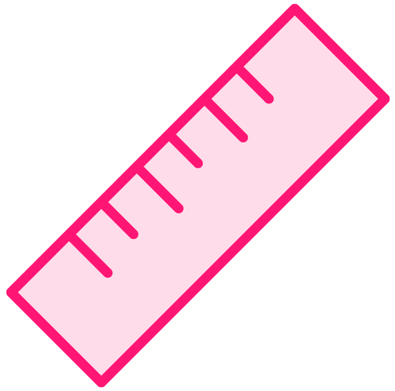
Importance of Data Quality



Critical

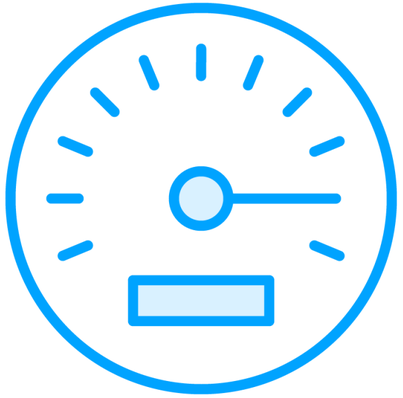


Performant



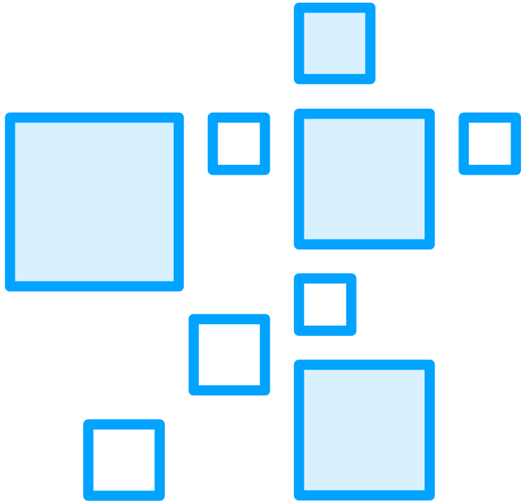
Accurate

High Quality Data Attributes

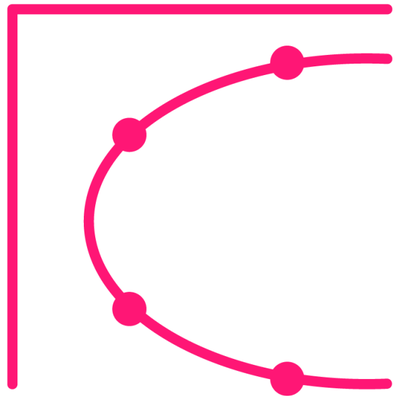


Relevant

Accurate

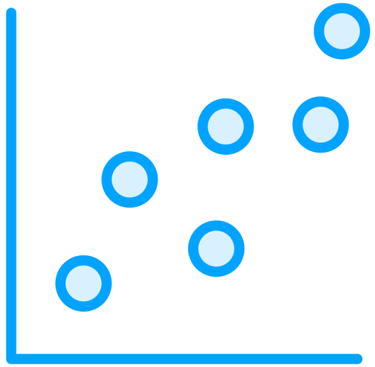


Diverse

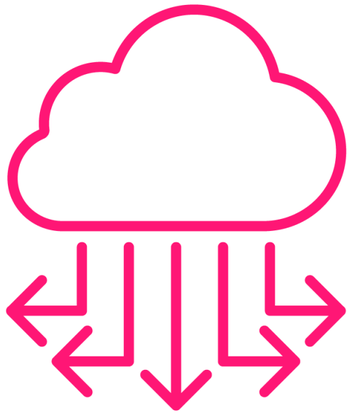


Train Models

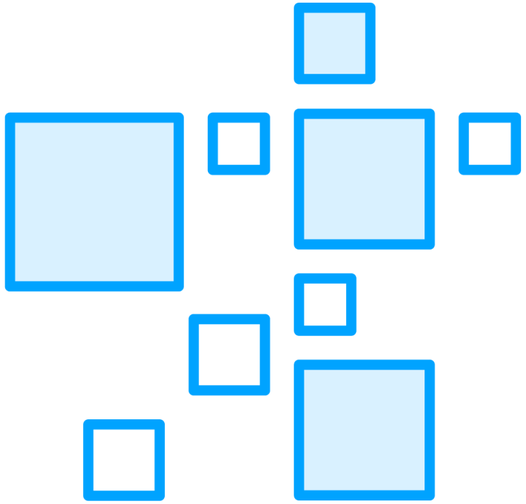
Poor Quality Data Attributes



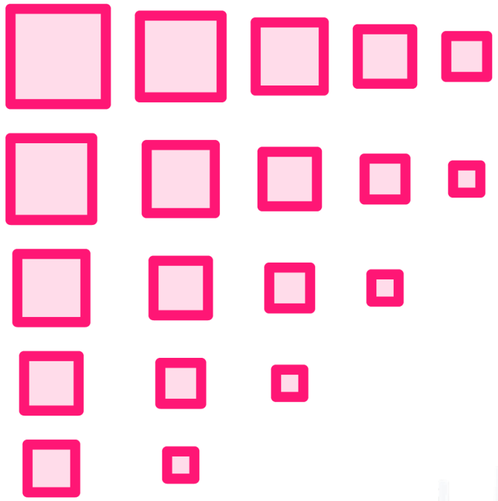
Fragmented



Inaccurate



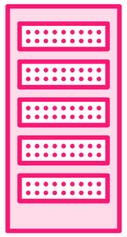
Poor signal to noise ratio



Unreliable models

Existing Assets

Infrastructure

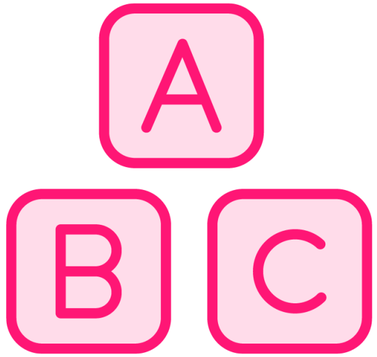


Servers, storage, and networks

Development tools, databases, and operating systems

Benefits of Leveraging Existing Assets

Reduce costs

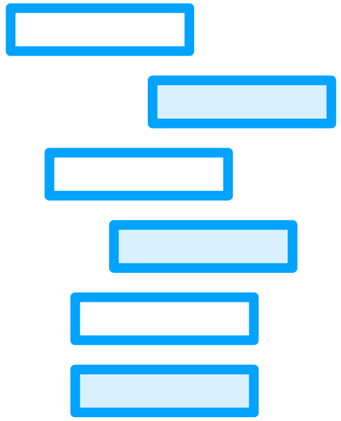


Reduce complexity

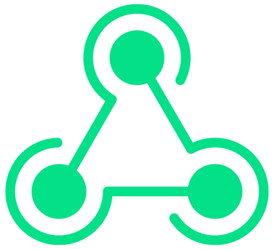
Improve scalability

Improve reliability

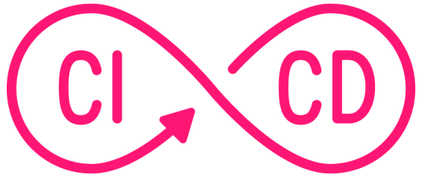
Benefits of Leveraging Existing Assets



Deeper integration



Workflows



Extract more value

Identifying Use Cases and Applications of Existing Technology

Identifying Use Cases

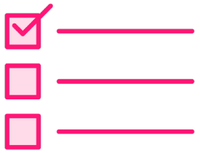
Conduct initial analysis

Identify data sources

Identify pain points

Identifying Use Cases

Consult with stakeholders



Determine priority

Validate each use case

Identifying Use Cases

Research industry trends

Relevant

High-impact

Example Use Case 1

Example Use Case 2

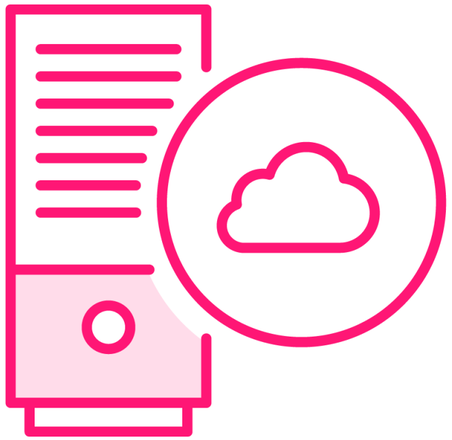
Data + Pain Point + Demand = Opportunity

Using Existing Technology

Cloud services

Microsoft Azure

Amazon Web Services



Google Cloud

Why Use Existing Technology

Out of the box modules, products, and services

Faster path to market

Low-code, no-code, and pro-code offerings

Cost savings

Examples of Existing Technology

Azure Cognitive Service for Language

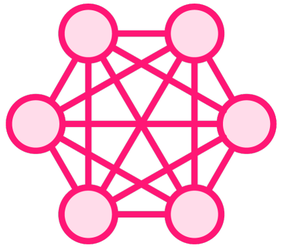
Computer Vision

Azure OpenAI Service

Examples of Existing Technology

Conversational AI

Document recognition and summarization

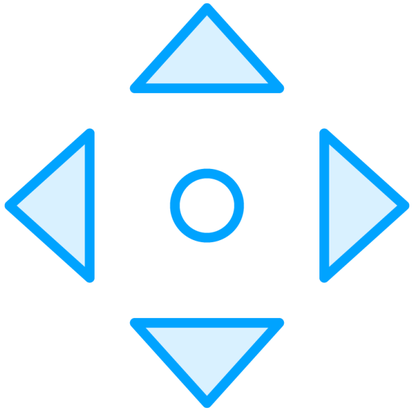


Drag and drop machine learning

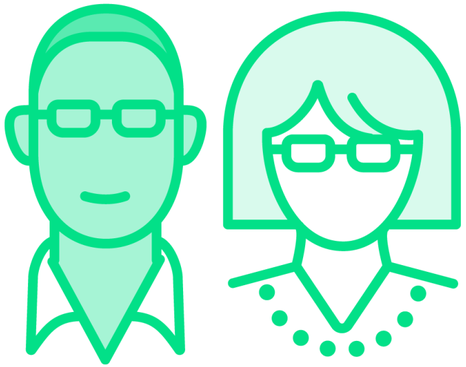
Leveraging cloud services accelerates the development of your AI strategy

Planning and Creating a Roadmap

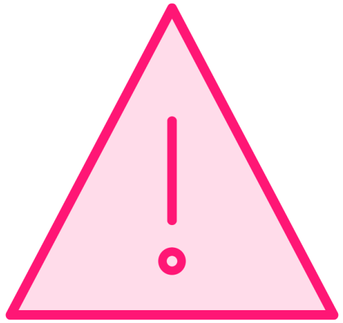
Why Plan and Create a Roadmap



Clear direction



Align AI initiatives with business objectives

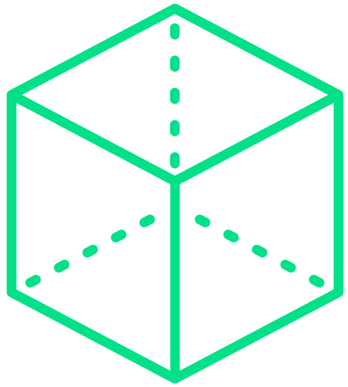


Advanced warning of potential issues

Why Plan and Create a Roadmap

Enhanced communication

Improved decision making

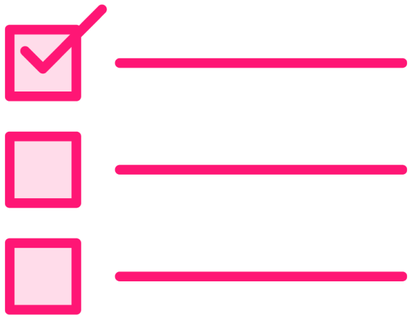


Transparency

What Should Your Roadmap Contain ?

Goals and objectives

Use cases

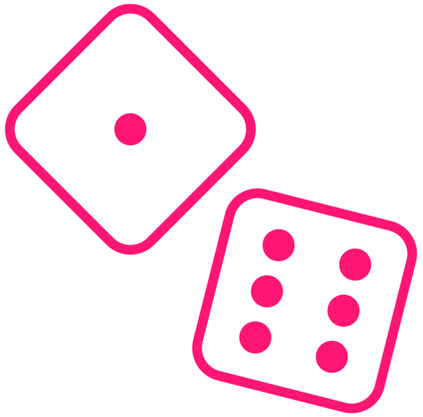


Current state

What Should Your Roadmap Contain

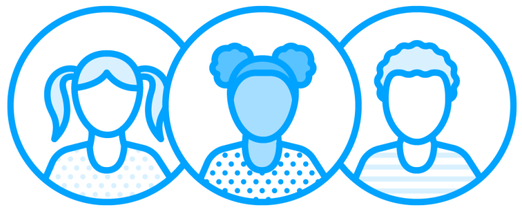
Gap analysis

Plan of action



Risk management

What Should Your Roadmap Contain



Resource allocation

Metrics

Evaluation processes

Key Steps Summary When Creating Your Roadmap

Define goals and objectives

Asset current state and determine gaps

Create a plan with milestones to tackle use cases

Identify risk

Allocate resources, build, deploy and evaluate

A roadmap improves the chances of project success.

Visibility and easily understood

Summary

- Partners, vendors, and technology
- Existing data quality and assets
- Use cases and existing technology
- Planning and creating a roadmap
